"ANACONDA Welding Rods help me live up to my slogan"

—says Eddie O'Rourke, owner Industrial Welding Company, Boston

"My slogan is, 'If It's Metal We Weld It'," continues Mr. O'Rourke. "My business depends on whether or not I live up to it. A good slice of our repair work calls for us to join cast and malleable iron and build up worn surfaces on castings. For this we always use ANACONDA-997 (Low-Fuming) Bronze Welding Rods. Bronze won't pull apart. From experience, we know ANACONDA-997 Rods 'tin' readily, flow freely at low temperatures, have good tensile strength. Work needs less preheating and finished welds need less machining. ANACONDA-997 Bronze Welding Rods are economical, too. They flow better, give us more welds per rod."

Anaconda Welding Rods are available from distributors throughout the United States and Canada. Industrial Welding Co. buys its rods from Whitehead Metal Products Co. in Cambridge, whose salesman is a practical welder and contributes helpful welding suggestions. Consult your Anaconda Distributor for practical advice on welding problems. For latest tips on welding techniques, write for FREE booklet B-13 to *The American Brass Co., Waterbury 20, Conn. ARC

Keep abreast of the times. Here's the latest news in arc welding

MID-YEAR 1954 finds a new electrode class—those with iron powder in their coatings. Continual improvements in the welding characteristics of this type of electrodes have resulted in a new AWS classification—E-6024. It possesses many of the desirable qualities of the E-6012 or the E-6020 and appears at an opportune time.

Other developments in arc welding are designed to cut into the use of manual electrodes. Improvements in the submerged-arc process now make it possible to use two or three electrodes at the point of welding. This has increased the popularity of automatic welding. The semiautomatic method, in which the weldor manually guides the welding head while the weld metal is deposited automatically, has likewise become an important factor in many small shop-welding operations. Here, again, a new development has come about to make this process even more important; namely, the introduction of a magnetic flux to permit semiautomatic welding to be done in all positions. Several manufacturers are now in the field with a magnetic flux. In some instances, it is used only in connection with hardfacing applications; in others in conjunction with mild-steel welding.

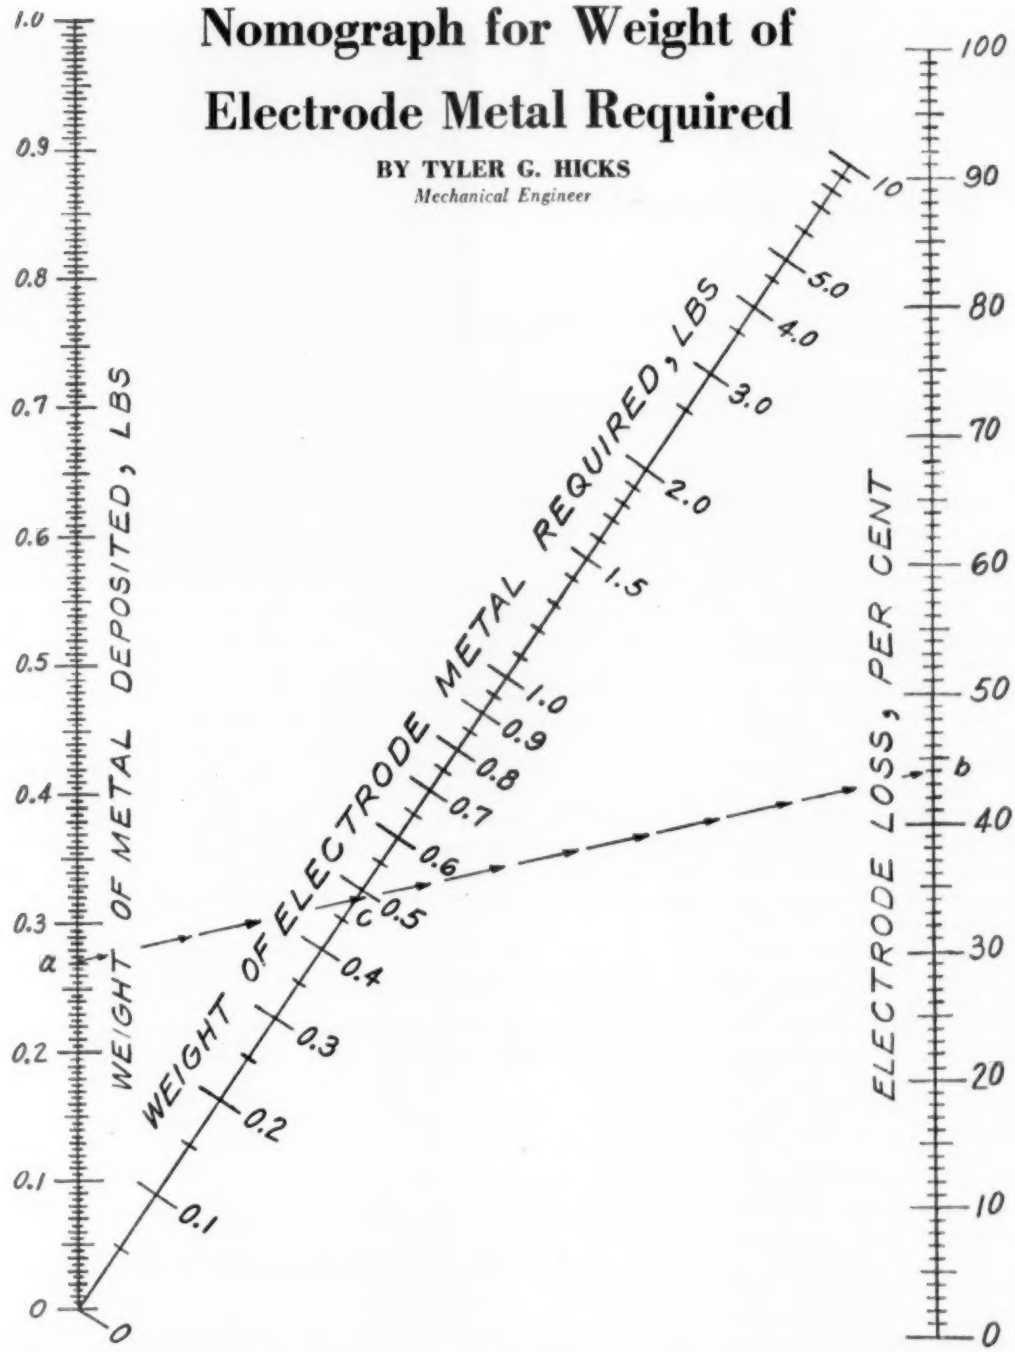
An entirely new concept was just recently introduced: slag-gas shielded arc welding. Here the electrode has the flux material in the core instead of in the coating like conventional electrodes. The gas for shielding the arc is independently supplied. This process offers the definite advantage of high welding speeds in all positions.

Welding power sources are becoming a point of controversy. The motor-generator set, industry's standby for many years, is now competing heavily with the a-c transformer. Improved dry-plate rectifiers have also brought the d-c rectifier welder to the front. For heavy welding operations, particularly in big automatic set-ups, desirable advantages are gained by using a constant-potential source of power. Both the motor generator and d-c rectifier welder are competing lustily, though it will be difficult to determine the winner for some time to come.

Inert-gas welding methods, both Mig and Tig, are being extensively used. Surprisingly, these processes are practical from an economic standpoint on many mild-steel welding applications.

Nomograph for Weight of Electrode Metal Required

BY TYLER G. HICKS
Mechanical Engineer



THE ACCOMPANYING chart gives quick estimates of the weight of electrode metal required for a given joint. It is based on the equation:

$$W = \frac{\text{weight of metal deposited, lb}}{1 - \text{electrode loss}}$$

where

W = electrode weight required, lb

Example: An angle joint welded with a ⅜-in. coated electrode requires 0.272 lb of metal per foot of length. What weight of electrode is needed per foot if electrode loss is 44%?

Solution: Enter the chart on the left at 0.272 lb of metal deposited and draw a straight line *ab* across to 44% electrode loss. At the intersection *c* with the sloping scale, read 0.49 lb of electrode metal required.

In estimating the total electrode loss, include the scrap end, spatter and coating losses. If specific data are lacking, scrap end loss can be assumed as 17%; spatter loss at 13% with bare electrodes; spatter and coating loss together as 27% with coated electrodes.

The weight of metal deposited includes the volume required to fill the joint plus reinforcement.

Although the equation used in plotting this chart is available in most welding texts, one McGraw-Hill Book Co. volume in which it can be checked is *Standard Handbook for Electrical Engineers*, 1949, Section 18, par. 219.

How Much Metal in a Fillet Weld?

Every day, without realization, many of us associated with the welding industry — engineers, designers, inspectors and welders — through thoughtlessness, are increasing the cost of fabrication.

In the case of the fillet weld, for example, an engineer will calculate the amount of welding required to develop full strength in a particular joint. After making these determinations, the size of the fillet is often increased because as calculated it appears to be too small. This policy of increasing the joint size is sometimes good practice. Occasionally, the calculated fillet is so small, the layman is inclined to doubt its strength and ability to stand up during the expected life of the pieces joined by welding.

If the fillet size could rest after the engineer has made his selection, everything would be fine but often this is not the case. Each time a new pair of eyes see the plans, the size of the fillet is changed. After having been "checked" by the designer, inspector, foreman and fabricated by the welder, that fillet which was calculated to be 3/16 in. in size has grown to a 3/8 in. fillet. A fillet weld that is much too strong and much too expensive!

While the size of the weld has only been doubled, there is actually four times as much weld metal in the deposit. Consequently the welding costs are at least four times as great as was necessary for the job.

The amount of weld metal required to deposit a fillet weld of a given size as compared to the amount required for a larger size fillet is given in Table 1. This Table covers fillets ranging in size from 1/8 to 1 inch and will amply equally as weld to 30-60 degree fillets as to the 45 degree fillets.

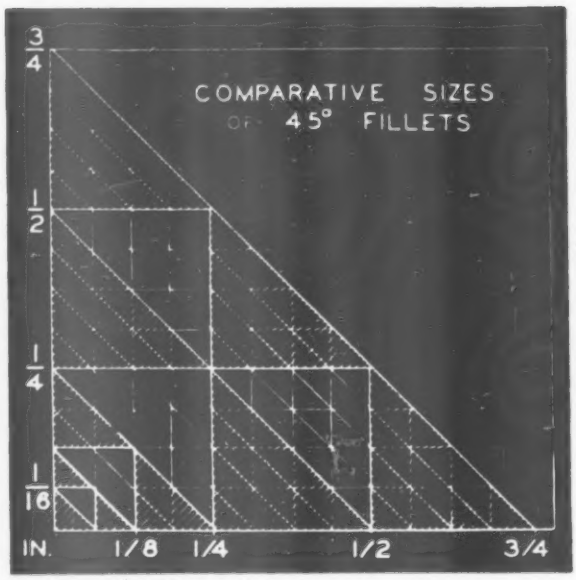


Figure 1 — Aided by this chart the cross-sectional area of various size 45 degree weld fillets may be compared readily.

The cross-sectional areas of 45 degree fillets are compared in Figure 1.

In Table 2 is given data showing the amount of welding electrode required in pounds per foot of fillet weld. This Table is based on 70% efficiency in deposit, i.e., 70% of the weight of the rod is deposited while 30% is lost through rod ends, coating and splatter. Electrode losses vary — 30% is considered the average loss, while in cases it will be as low as 20% or as high as 50% depending on the size of the electrode, the welder, and other conditions.

It should be noted that the 30-60 degree fillet, which in many cases is considered more satisfactory than the 45 degree fillet, requires twice as much weld metal to deposit a fillet of the same height.—T. B. J.

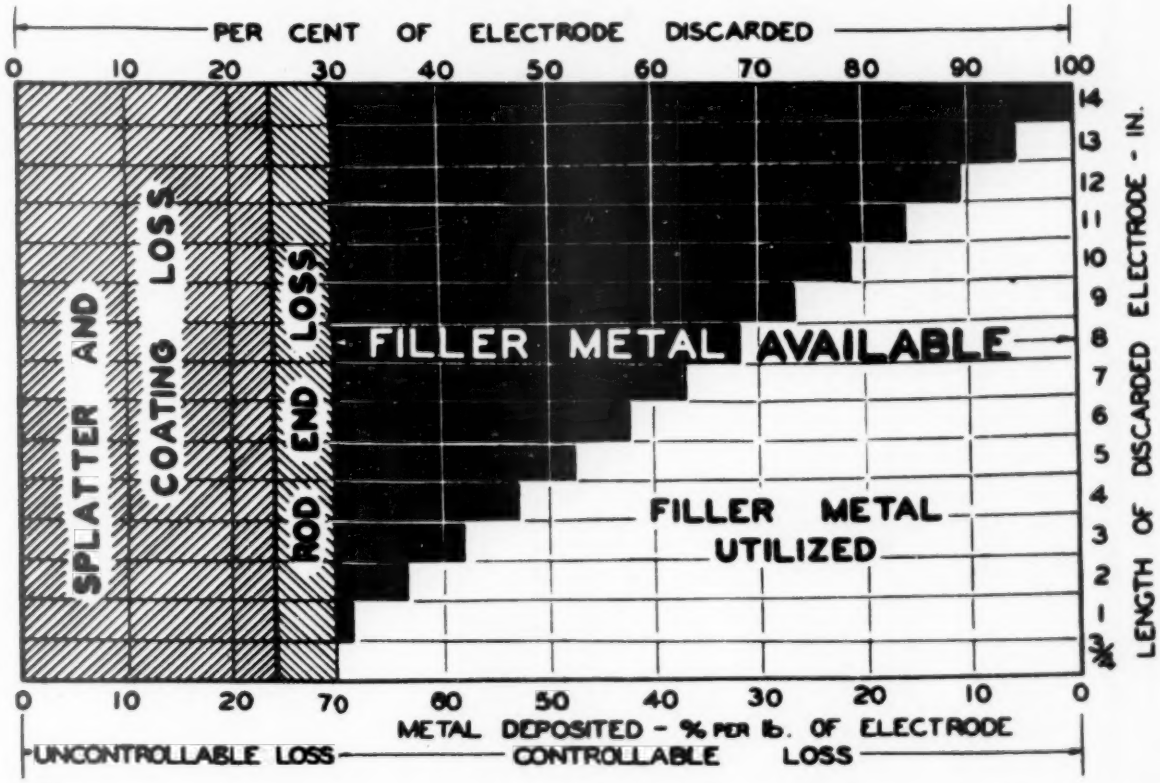
What Per Cent of Your Welding Electrodes Do You Use?

By Ted Jefferson, Editor



WHAT PER CENT of your welding electrode do you use? Ask any weldor and the reply will be most likely "100 per cent" or "Practically all, 90 per cent at least." A trip through nearly any welding shop, however, will reveal that someone is mistaken. The miscellaneous assortment of varied length rod-ends to be seen on the shop floor will indicate that far from the maximum available filler metal is being obtained from each electrode, in some instances 40 per cent would be more nearly correct.

The above graph, which is based on actual results obtained from 3/16 in. heavily coated electrodes 14 in. in length, indicates that the maximum amount of filler metal that can be deposited with this diameter electrode is 70 per cent of the weight of the rod. This 70 per cent, the maximum, will be obtained only when the minimum rod end (¾ in.) is discarded. Since the average discarded rod end measures about 2 in. in length, only 64 per cent of the available filler metal is utilized.

It may be seen readily that the length of the discarded rod ends soon becomes an important factor in the cost of job unless their length is controlled and the losses kept to a minimum.

The natural question is "How can these losses be controlled?" In one instance, a shipyard, the weldors are required to turn in rod ends for new electrodes; as a result, the effective consumption of electrodes was increased from 56% to 65% for a saving of $7500.00 per year on their electrode purchases. Thus a 9 per cent increase in the deposit of the available filler metal in an electrode resulted in a 14 per cent reduction in the yearly electrode bill.

It should be remembered that the above graph is based on 3/16 in. dia. electrodes, for larger electrodes the losses would be less and on smaller electrodes considerably greater in proportion to size.

GAS

After 50 years, the flame processes continue to hold center of stage

CELEBRATING its fiftieth year of use in this country as a means of joining and severing metals, the oxyacetylene flame burns brighter than ever before. Last year more than 25,000,000,000 cu ft of oxygen and 6,500,000,000 cu ft of acetylene were consumed for welding and cutting purposes. In view of the tremendous popularity of the arc processes, it is surprising that gas welding still has an important place, but it has and is apparently irreplaceable for certain types of work. Major use of the welding gases, however, is for flame-cutting steel plates. Flame-hardening, flame-cleaning, flame-straightening and other flame processes are likewise growing in importance.

It is difficult to conceive of a welding operation wherein the oxyacetylene flame does not somewhere play a part. One very important use is to bevel or "vee" the edges of plates preparatory to welding. Multiple torch tips now make it possible to cut the most complicated edge with a single pass of the flame-cutting machine, materially reducing the cost.

In scarfing operations in steel mills, the flame of the oxyacetylene torch make it possible to produce finer grades of steel. Since the imperfections are removed from the ingot or billet before the rolling operation, they are eliminated forever. Mechanized scarfing methods are now reducing the cost to steel mills of this vitally important operation.

Flame-cleaning, flame-hardening, flame-softening and a multitude of other flame-treating processes produce a continued demand for oxygen and acetylene. Flame-cleaning done prior to painting prolongs the life of the steel so treated and greatly lowers future maintenance. Old paint may be removed prior to a fresh paint job. Mill scale is also removed, and the surface is thoroughly dried and at a temperature ideally suited to receive a new coat of paint.

An important flame technique that is bound to receive a much wider recognition is flame-straightening. Through the judicious application of the oxyacetylene flame, distorted steel members can be straightened quickly and easily. This has been repeatedly proved on the West Coast, where damaged bridge members have been straightened in place just by the proper application of the oxyacetylene flame.

Temperature Data*

This Useful Chart Includes Melting Points And Other Temperature Data

THE accompanying chart not only lists the melting points of various alloys and metals but also serves as a convenient means for conversion between Centigrade and Fahrenheit temperature scales. In addition, on the far right of the scale are shown the color designations that are commonly used in judging the temperatures of hot metal by color.

Melting Points

This chart should prove useful to all welding operators for it contains basic information on working with metals at elevated temperatures. Reference to the chart, for instance, shows why aluminum and aluminum alloys, because of their low melting points, give little or no indication by change in color when they approach welding heat. On the other hand, the high melting point of wrought iron explains why considerably more heat is required to weld this metal than is required for cast iron, for instance.

Temperature Color Scale

Another use for the chart is in estimating the temperature by color. For instance, instructions may require that the part be preheated to 1,100 deg. F. before welding. If you are without a thermocouple or other means for accurately measuring high temperatures, reference to the chart shows that the part, at 1,100 deg. F. would have a blood-red color. With a little experience, you can estimate this fairly closely by eye. In this connection, it should be mentioned that the color scale is for observations made in a fairly dark place and without welding goggles. As the light increases, the color groups on the scale will apply to higher temperatures.

Conversion Data

Finally, the chart is a ready means for converting Fahrenheit to Centigrade, and vice versa. Suppose you are familiar with the Fahrenheit scale, yet instructions call for the quenching of a welded part from 900 deg. C. Reference to the chart shows this to be approximately 1,650 deg. F.

Jiffy Joining Chart

GAS-WELDING processes you may select in order to join a given material to a similar or dissimilar metal. As an example, take malleable iron. You can fusion weld it only to itself, but you can join it to everything except aluminum, magnesium, or white metal by using either brazing or braze welding. Aluminum, as another example, can be joined only to aluminum, but either fusion welding, braze-welding or brazing may be employed.

Resistance

Is the resistance-welding industry overlooking a few good bets?

NEW USES for resistance welding continually keep this process in the news. New companies with new ideas are entering the field. In spite of the stimulation of competition, however, it sometimes seems that makers of resistance welders and equipment fail to see the woods for the trees. Many obvious uses of resistance welding are still being overlooked or are going into other fields of fabrication. Perhaps this industry's biggest problems are marketing ones. A certain complacency with the *status quo* might likewise be responsible.

From a technical standpoint, the industry's achievements have been magnificent. Huge machines, some capable of making hundreds of spot welds in one fell swoop, are helping to turn out refrigerators, dish washers, automatic clothes washers and other home appliances. Indeed, appliance manufacturers have become so dependent upon resistance welding that there would probably be very few of these items produced if more costly methods of fabrication had to be utilized. The cost of home appliances would skyrocket without resistance welding and sales would inevitably decline as a new refrigerator or a new clothes washer became something only the rich could afford.

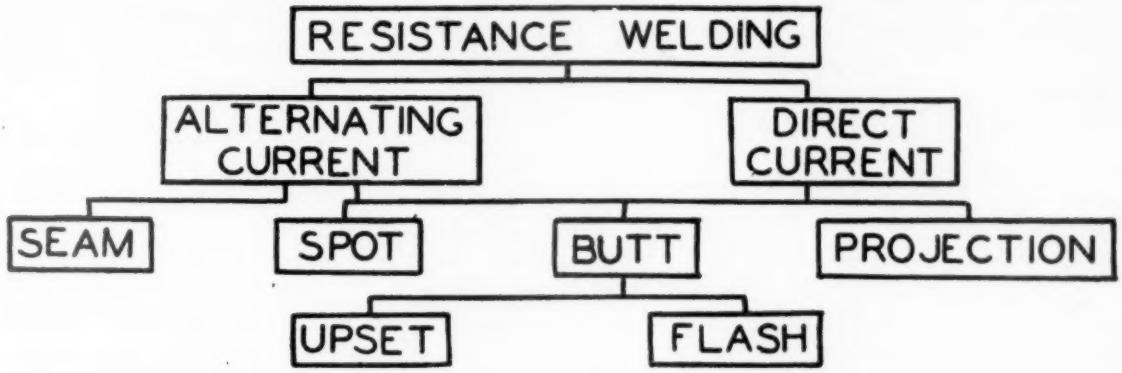
The automotive industry is also dependent upon resistance welding, but there is still a tremendous job that the manufacturers of equipment can do in this field. More adequate and intelligent use of resistance welding in the production of automobiles could result in sales of millions of dollars more in welding machines to this industry. And the cost of each car produced could be cut by several hundred dollars.

The possibilities of resistance welding in the aircraft field are just as unlimited. Again, it will take originality in design and thinking to forge ahead.

There seems to be a need for a finer set of definitions on resistance-welding electrode alloys. The broad classifications now covered by the RWMA standards seem to lack the precision required to meet modern industrial standards. A lot of good work has been done in the development of resistance-welding alloys. For this reason an effort should be made to tie down this standard a bit tighter so that when a specific alloy is requested exactly that alloy will be delivered. Variations over a wide range exist today, say some users of equipment.

With better engineering and sales appeal, the backlog for this industry can be made enormous. The year 1954 should offer a tremendous challenge to makers of resistance-welding equipment.

Resistance Welding Fundamentals



Definition

Resistance welding is a pressure welding process wherein the heat for welding is obtained by the resistance to flow of an electric current.

Principle

Resistance welding is accomplished when two or more pieces of metal are clamped between copper electrodes and an electric current is passed through them. Heat generated between the pieces of metal reduces the metal to a plastic state; then clamping pressure induces fusion. Pressure is required to make the resistance between the electrodes and the metal low as compared to the resistance between the pieces of metal; this condition must prevail when power is applied if burning of the working surfaces is to be avoided.

Fundamental Factors

The three fundamental factors which must be controlled in resistance welding are:

1. Current.
2. Time.
3. Pressure.

Heat Generation

It should be remembered that in any resistance welding process, the heat is generated within the metal and is not heat absorbed from an outside source. For this reason, the heat generated in resistance welding may be determined by the simple formula: Heat equals (Current)^2 times Resistance times Time or $H = I^2RT$.

Heat Generated

The energy represented by the expression I^2RT may be expressed in electrical units as watt-seconds or heat units as calories. If expressed in calories, a factor of 0.24 must be inserted in the formula as a watt-second is 0.24 calories. When resistance welding heat is to be discussed in calories, the formula becomes: Calories$=0.24\ I^2RT$.

Current Variables

Resistance welding current has three fundamental variables which must be controlled for consistent results. These are: (1) timing, (2) characteristic of the current wave during welding and (3) value of the current for a given weld.

Timing

Weld current timing in resistance welding may be accomplished by one of several methods. For example: (1) manually timed magnetic contactors, (2) mechanically timed magnetic contactors, (3) electrically timed magnetic contactors, (4) synchronous-motor-operated contactors, (5) electrically or mechanically timed ignitron tube contactors, (6) fully synchronous electronic timers.

Resistance Factors

The resistance in resistance welding is obtained from three sources: (1) The specific resistance of the material to be welded; this resistance is constant. The resistance from the other sources varies according to the pressure used. These resistances are: (2) resistance between the electrode and the work and (3) resistance between the pieces to be welded.

Pressure Methods

Pressure in resistance welding may be obtained: (1) mechanically, (2) pneumatically, (3) hydraulically, or (4) by a combination of one or more of these means.

Spot Welding Variables

Ten variables affect spot welding results:

1. Human element.
2. Pressure.
3. Current.
4. Time.
5. Material.
6. Length of horns.
7. Distance between horns.
8. Power factor of welder and circuit.
9. Condition of electrodes and work.
10. Type and condition of work.

RWMA Electrode Material Standards

RECOMMENDED uses of RWMA standard alloys for electrodes for resistance welders are as follows:

Group A—Copper-Base Alloys

Class 1 alloy is a superior substitute for pure copper as an electrode material and is recommended as a general-purpose material for resistance-welding applications. It may be used for spot-welding electrodes, seam-welding wheels, seam-welder shafts, flash and butt welding dies, projection-welding dies and welder fixtures.

Because of its high electrical and thermal conductivity, Class 1 alloy is specifically recommended for the spot welding of aluminum alloys, magnesium alloys, coated materials (terne plate, tin plate, galvanized iron, cadmium plate), brass and bronze. It is not used in cast form.

Class 2 alloy is a superior resistance-welding electrode material specifically recommended for high-production spot and seam welding of clean mild steels, low-alloy steels, stainless steels, low-conductivity brasses and bronzes, nickel-silver, nickel, nickel alloys and Monel. This material is heat-treatable. It is suitable for projection-welding dies, seam-welder shafts and bearings, flash and butt welding dies and current-carrying structural members. In cast form, it gives high strength and high electrical conductivity for such uses as gun welder arms, welder platens and secondary circuit structural members.

Class 3 alloy is also heat-treatable and is recommended for projection-welding dies, flash and butt welding dies, current-carrying shafts and bushings. In cast form, it has higher strength than Class 2 and is recommended for highly stressed structural members that carry current and for heavy-duty offset electrode holders. Though not generally recommended for spot-welding electrodes, Class 2 alloy may be used advantageously to spot weld steels of high electrical resistance (stainless, etc.)

Group B—Copper-Tungsten Alloys

Class 10 material is recommended for facings or inserts on projection-welding electrodes and flash and butt welding dies in applications where high electrical conductivity is desirable and a degree of malleability is necessary.

Class 11 (a harder material than Class 10) is also recommended for facings and inserts on flash and butt welding dies and for general-purpose projection-welding electrodes. It may also be used for bearing inserts on seam welders and for the facings of electroforming or electroforging dies. It is recommended for the spot welding of stainless and other steels having high resistance.

Class 12 material is specifically recommended for heavy-duty projection-welding electrodes and for die facings in electroforming and electroforging applications. It is suitable to use as die material for the electrical upsetting of rivets and studs.

Class 13 material is principally recommended for the welding or brazing of nonferrous metals having relatively high electrical conductivity. Typical applications are cross wire welding of copper and brass wires, the welding of copper wire braid to brass and bronze terminals. Generally, special set-ups and procedures are required for this type of work.

The table below, published through the courtesy of the Resistance Welder Manufacturers' Association, lists the minimum standard requirements for hardness, conductivity and strength of materials in these various classifications.

The majority of electrode requirements are met by RWMA standard alloys for spot, seam and projection welding. Other processes frequently employ the use of electrode materials not covered at present by these standards.

Resistance Welding Dos and Don'ts*

DOs

1. Use the proper electrode material for the job you are doing.
2. Use standard electrodes wherever possible.
3. Use the most suitable tip diameter for the thickness of the stock being welded.
4. Connect the water inlet hose to the proper holder inlet so that water flows through the center cooling tube first.
5. Cool spot-welding tips internally with cool water flowing at a rate of at least 1½ gal per minute through each tip.
6. Be sure that the internal water-cooling tube of the holder projects into the tip water hole to within ½ in. of the tip-hole bottom.
7. Be sure that the top of the adjustable water-cooling tube in the holder is cut at any angle to avoid jamming the tip down and shutting off the water.
8. Place a thin film of cup grease on the tip taper prior to inserting it in the holder. This will make it easier to remove.
9. Use ejector-type holders for easy removal of tips and to avoid damage to tip walls.
10. Keep the tip taper and holder taper clean, smooth and free from foreign deposits.
11. Dress spot-welding electrodes often enough to maintain weld quality.
12. Dress electrodes to their original contour in a lathe whenever possible.
13. Clean and tighten regularly all electrical connections in the secondary circuit.
14. Keep the welder throat area to the minimum permissible dimensions.
15. Lubricate the resistance welder's motor, gears and slides at periodic intervals.
16. Calibrate all pressure-applying mechanisms so that the exact welding pressure can always be known.
17. Clean—either chemically or mechanically—all material to be welded that has dirty, scaly, oxidized or otherwise contaminated surfaces.
18. Use suitable automatic current-timing devices.
19. Have all timing devices suitably calibrated.
20. Use synchronous electronic timing controls for short timing periods or in the welding of materials having critical weldability.
21. Mount timing devices rigidly to protect them from vibration or abuse and mount them for ready servicing.
22. Use synchronous controls, providing interrupted timing periods, in all seam-welding applications.
23. Use electronic or magnetic welding contactors developed specifically for welding applications.
24. When using an ignitron control with a welder drawing less than 40 amperes from the line, provide a load resistor across the primary so that the current does not fall below 40 amperes.
25. Keep all electrical contacts in relays, switches and contactors in good condition by frequent inspection and dressing or replacement if necessary.

DON'Ts

1. Never use unidentified electrodes or electrode materials.
2. Avoid special, offset or irregular tips when the job can be done with a standard straight tip.
3. Don't use small tips on heavy-gauge welding jobs, or large tips on small work.
4. Never use water hose that will not fit the holder water-connection nipples snugly.
5. Do not allow water connections to become leaky, clogged or broken.
6. Avoid using holders with leaking or deformed tapers.
7. Do not permit the adjustable water tube to be "frozen" by an accumulation of deposits. A few drops of oil periodically will keep the tube free.
8. Do not allow electrodes to remain idle for extended periods in tapered holder seats.
9. Don't use pipe wrenches or similar tools to remove electrodes.
10. Avoid the use of white lead or similar compounds to seal a leaking taper.
11. Never permit a spot-welding tip to mushroom enough to make dressing difficult.
12. Never dress electrodes with a coarse file.
13. Don't permit flash particles to accumulate on the welding transformer.
14. Do not use a long welder arm extension or a wide arm separation unless the shape of the parts to be welded necessitates it.
15. Shun lubricants which are not recommended by the welder manufacturer.
16. Never permit sliding pressure members to become too tight or jammed since this will increase the frictional forces and inertia of the moving members.
17. Never weld unclean metals, scaly stock or metals with poor surface condition.
18. Avoid the use of slow-operating magnetic contactors if you are doing precision work.
19. Do not employ non-synchronous timing devices for welding materials with critical welding characteristics—*i.e.*, aluminum, magnesium and brass.
20. Avoid expensive synchronous timing devices for long timing, non-critical applications.
21. Don't use welding contactors or ignitron controls of capacity not within the rating of the welding machine and duty cycle of the application.
22. Never operate a synchronous ignitron control with the secondary of the welder open circuited.
23. Never use non-synchronous timing devices for short timing (less than 4 or 5 cycles).
24. Don't expect the timer to operate satisfactorily if the limit relay or switch in the timer-welder circuit chatters, or the contacts are oxidized or pitted.
25. Do not expect the timer to provide uniform timing pulses if the primary voltage regulation is poor. Ascertain timer manufacturer's recommended limits of voltage variation.

Grinding

Do's and don't's for better weld grinding and finishing

A PRIMARY factor in keeping down the costs of grinding and finishing is good housekeeping before welding. Care in the storage of steel stock can reduce cleaning to a minimum.

Do not drag plate or sheet across the shop floor; it grinds dirt and foreign matter into the welding zone and makes postweld problems. Wire brushing before welding is always a good practice. In the case of stainless steel, use only stainless-steel bristle brushes; other types tend to leave tiny particles embedded in the surface to cause rust and corrosion.

Don't grind any metal surface too long in one spot. It will buckle and warp the surface. Too coarse a grinding wheel will leave deep scratch marks. Removing them often leaves the metal too thin. Deep scratches can and do cause fractures to start in stress areas.

Grinding wheels of suitable grit should be used for different metals. One type will not grind all metals satisfactorily. For the first cuts on rough welds, be sure to use coarse wheels. Some operators just simply don't like to bother changing them. Rough, heavy welding beads on tough steels such as stainless require the use of rubber- or Bakelite-bonded aluminum oxide wheels with grit varying from Nos. 16 to 36. Vitrified wheels tend to "load" when used on some metals so choose them with care. Electric and air-driven portable grinders should maintain proper rpm. Eliminate "hammering" by careful trueing, and round the edges of the wheels to prevent gouging. Lard, oil or a suitable cutting oil may be applied to some work; such a lubricant has a tendency to retard "loading" and prevent harsh, abrasive cuts.

In some metals, you must grind along the welding bead, not across it, to avoid cutting metal adjacent to the weld. Use back-up bars and heavy strips on light-gage sheets and strips. Apply a wet cloth to the surface occasionally or "move on" to eliminate low spot or indentations caused by overheating.

Buffing operations on stainless steel are always performed with special abrasive compounds prepared for specific steels. Buffing should not be attempted on a surface coarser than that resulting from No. 200 or No. 220 grits used with lubricants.

Safe Grinding Wheel Speeds

It is good practice to operate a grinding wheel as near to the speed recommended by the maker as possible. In general, for cylindrical grinding, wheels should be run from 5,500 to 6,500 surface feet per minute; for surface grinding from 4,000 to 6,000 s.f.p.m.; for cutter grinding from 4,500 to 6,000 s.f.p.m. and for wet tool grinding from 5,000 to 6,000 s.f.p.m. Other speeds are given in Table I.

After you have found the recommended wheel speed at the periphery, as given in Table I, the problem arises of determining the wheel diameter for a given grinder speed (revolutions per minute). The arithmetic has been performed for you in Table II. Find the proper peripheral speed above one of the columns and run down the column until you reach the nearest rpm to your grinder speed. The safe diameter of the grinding wheel can then be found in the columns at extreme left or extreme right.

Example: For snagging a weld with a resinoid wheel, recommended peripheral speed is 7,000 s.f.p.m. With a grinder speed of 4,400 rpm, the wheel diameter should be 6 in. (figures shown in rectangles).

The grain, grade and structure usually recommended for any certain operation are based on the assumption that approximately the recommended speed will be employed. If for some reason this is not possible, then the grade at least should be changed to conform to the different speed. Too slow a speed means wastage of abrasive without too much useful work in return, whereas an excessive speed may result in hard grinding action and may introduce the danger of the wheel breaking through centrifugal force* or burning the work.

*"Centrifugal force" is the force that tends to rupture a given wheel when overspeeding. It increases as the square of the velocity of the wheel. For example, the centrifugal force in a wheel running at 5,500 s.f.p.m. is 49% greater than in the same wheel running 4,500 s.f.p.m., although the speed is actually only 22% greater.

To find the peripheral speed of a wheel in feet per minute (S.F.P.M.), multiply the circumference in feet by the wheel revolutions per minute.

$$\text{S.F.P.M. of wheel} = \frac{\text{Diameter in inches} \times 3.14 \times \text{R.P.M.}}{12}$$

To find the number of revolutions per minute (R.P.M.) of the wheel spindle given the peripheral speed (S.F.P.M.) and the diameter of the wheel, multiply the peripheral speed in feet per minute by 12, and divide the product by 3.14 times the diameter of wheel in inches.

$$\text{R.P.M. of wheel spindle} = \frac{\text{S.F.P.M.} \times 12}{3.14 \times \text{diameter in inches}}$$

METALS

All metals can be welded, but not all can be welded by every process

MILD steel continues to be overwhelmingly the favorite of the metals welded. Last year 101,281,525 tons were produced of just plain low-carbon steel. Iron alloys other than stainless steel accounted for 9,279,117 tons, and stainless production totaled 1,049,077 tons. Though stainless continues to grow in popularity all the time, its output last year represents only 1% of the number of tons of mild steel produced.

By way of comparison, last year's production of aluminum was 1,252,200 tons, of magnesium 93,075 tons, of copper 1,465,000 tons, of nickel 104,781 tons and of titanium 3,400 tons. Aluminum and stainless steel are about the same, both representing about 1% of the tonnage of mild steel.

All of these metals can be and are being welded, but finding the right process for a particular metal or alloy is sometimes a hard job, requiring much experimentation or a lengthy search through voluminous literature.

Just for an example, three 1954 issues of WELDING ENGINEER will carry a total of 13 pages of editorial material on the welding of just one metal, aluminum. And, if we must admit it, our information is rather tersely presented. By no means an exhaustive treatment.

Titanium has been the subject of more welding papers of recent years than any other metal. At the Buffalo meeting of AWS, three papers were presented on the welding of titanium, at the Cleveland meeting last fall six papers, at the Houston meeting of a year ago six papers. A total of 15 technical papers. When production problems on titanium are licked and it is able to compete with other metals on a price basis, a good solid foundation of welding information will be available.

Things are changing all the time, even in the welding of mild steel. What about the low-hydrogen electrodes? Electrodes with iron powder in their coatings? The new slag-gas shielded arc process? Furthermore, Mig welding may be successfully adapted to this field. An article by G. C. Cristopher and R. C. Becker, appearing in the March, 1953, issue of WELDING ENGINEER, reveals that for smaller fillet joints the cost of inert-gas welding, including the cost of the shielding gas, was only half the cost of manual shielded-arc welding.

Effects of Alloying Elements in Steel

By T. B. JEFFERSON

Aluminum

Aluminum is extensively used as a deoxidizer in steel production. As such, it is an effective purifier. Aluminum also lessens grain growth by forming dispersed oxides or nitrides.

Carbon

Carbon is the principal hardening agent in steel. In most cases, alloy steels containing carbon up to about 0.20% are for hardening by carburization. Alloy steels containing over 0.20% carbon are generally considered heat treating steels and are heat treated by quenching and drawing to obtain increased strength. In some cases, these steels are used in their as-rolled condition. As the principal hardening element in most alloy steels, carbon has about the same effect as it does in steels which do not contain alloys.

Chromium

Chromium, as an ingredient in alloy steel, is a hardening element which also tends to increase the strength of the steel. In the higher percentages, from 12 to 30%, chromium tends to increase the corrosion resistance and oxidation resistance of the steel. This holds true at both high and low temperatures. Consequently, chromium is one of the basic ingredients used in the production of stainless steels. It is also one of the basic ingredients of steels that are to be used at high temperatures where resistance to oxidation is desired. There is little loss of strength in chrome steels at temperatures up to 900 F.

Cobalt

Cobalt is used as an alloying agent in steel where high strength or high hardness at high temperatures are desired. It imparts the quality known as "red hardness."

Manganese

Manganese is the most indispensable alloying ingredient used in steel making. When manganese appears in steels up to about 0.80%, it is generally intended for the sole purpose of combining with sulphur or phosphorus to offset embrittlement and "hot shortness." In higher percentages, 1 to 15% (with one exception), manganese increases the toughness of the metal and also increases the hardening ability of the metal involved. The exception is a content of between 3 and 4% manganese in steel, which tends to promote embrittlement.

Molybdenum

Playing an important part in alloy steels during these days of conservation, molybdenum is used to replace other strategic metals. Molybdenum tends to increase the hardness and the endurance limits of steel. It likewise contributes to deep hardening. It decreases the tendency toward high temperature creep or slow stretching of steel under stress at high temperatures. Molybdenum also increases the corrosion resistant qualities of stainless types of alloy steel and prevents temper embrittlement of low chrome alloys. Generally it is used in comparatively small quantities, ranging from about 0.10 to 4.00%.

Nickel

Nickel is used as an alloying agent in steel for the purpose of increasing strength and toughness at low temperatures. Most general quantities are from 1 to 4%, although, in some applications, the nickel content will run as high as 36% or more. In all cases, the addition of nickel will increase the strength without decreasing the toughness of the steel; there are, however, instances where the addition of nickel promotes temper embrittlement. Steels having a nickel content of 24% are practically nonmagnetic, and when the quantity is increased to 36% the coefficient of expansion due to heat (up to 900 F) is very small. In the lower range of nickel, i.e., up to about 4%, it is usually estimated that the tensile strength is increased about 6,000 psi for each additional 1% of nickel.

Phosphorus

Phosphorus is an element usually found in all steels. In high percentages it is considered an impurity. In low percentages, however, it improves the machinability of high carbon steel as well as of low carbon steel. For this purpose, the phosphorus content is usually restricted to about 0.05%, particularly so in steels in the higher carbon ranges. Phosphorus slightly improves the strength and corrosion resistance of low carbon steel.

Silicon

Silicon acts to promote fluidity of the molten steel bath by effecting a control over the oxygen content of the steel. It is used extensively in high percentages to produce certain magnetic characteristics in steel used for electrical and magnetic applications. Its addition tends to improve oxidation resistance and increases the hardenability of steels carrying non-graphitizing elements. Silicon also contributes to the strength of low alloy steels.

Tungsten

Tungsten is used as an alloying element in tool steel and tends to produce a fine, dense grain when used in relatively small quantities. When used in larger quantities, from 17 to 20%, and in combination with other alloys, it produces a steel that retains its hardness at high temperatures. Tungsten is also used in certain heat-resistant steels where the retention of strength at high temperatures is important. This element is usually used in combination with chromium or other alloying agents.

Vanadium

Vanadium is used in the production of steel as an agent to promote control of grain size. It tends to promote hardenability and causes marked secondary hardness, yet resists tempering. The addition of vanadium tends to produce fine grain structure during the heat treating process. Because of this, vanadium often eliminates the bad effects of overheating.

PRE-HEATING PRIOR TO WELDING WILL

1. Eliminate the danger of formation of cracks.
2. Reduce hardness.
3. Reduce distortion.
4. Reduce or prevent Shrinkage Stresses.

THE NEED FOR PREHEATING INCREASES AS THE FOLLOWING FACTORS ARE CHANGED

1. The larger the mass being welded.
2. The lower the temperature of the pieces being welded.
3. The lower the atmospheric temperature.
4. The smaller the weld rod in diameter.
5. The greater the speed of welding.
6. The higher the Carbon content of the steel.
7. The higher the Manganese content.
8. The greater the Alloy content in air hardening steels.
9. The more the air hardening capacity of the steel.
10. The greater the difference in mass between the two pieces being joined.
11. The more complicated the shape or section of the parts.

A B C's of Galvanic Corrosion*

If two unlike metals are connected to one another in a corrosive liquid such as brine, one metal is often corroded at a much faster rate than usual, while the other metal either remains clean or is corroded at a much slower rate than usual. This type of corrosion is always associated with the generation of electrical current and hence is described as galvanic corrosion. It is the galvanic action which speeds up corrosion beyond the ordinary rate. The metal corroded by the galvanic effect is said to be anodic; the more or less protected metal is termed cathodic. Corrosion engineers also speak of the cathode as the "more noble" metal and the anode as the "less noble" metal—using the word "noble" in a broader sense than its original meaning in the case of precious metals such as gold and platinum.

Galvanic Series

Experiments have been conducted to arrange metals in a galvanic series. Such a series shows the tendency of metals and alloys to form significant galvanic cells and indicates probable direction of the galvanic effects. Within the galvanic series, the metals and alloys may be divided into groups. The members of a group have no strong tendency to produce galvanic corrosion with each other and so are relatively safe to use in contact with each other unless the area of the less noble metal is markedly smaller than that of the other. The coupling of two metals distant from each other in the series will frequently result in galvanic or accelerated corrosion of the less noble metal. The farther apart the metals stand, the greater will be the galvanic tendency.

The galvanic series given in the middle column is based upon a series of experiments on and practical experience with many common corrosives. It should not be used without additional experimental tests when unusual corrosives are encountered or other unusual conditions prevail.

Anode and Cathode Effect

The relative areas of two metals forming a galvanic couple will have a very important bearing on the extent of the corrosion. Under many conditions the corrosion loss due to galvanic action is very nearly directly proportional to the area of the more noble metal. Thus if a piece of steel is coupled to a piece of copper having a surface area of 100 sq in., the corrosion loss of the steel is increased by an amount which is roughly 50 times what it would be if the same piece of steel were coupled to a piece of copper having an area of 2 sq in. For this reason it is wise to avoid galvanic couples in which the exposed area of the lower (more noble) metal in a galvanic series is much greater than that of the higher or less noble metal. As a practical example, it would be definitely dangerous to use steel welding on a Monel plate but relatively safe to use Monel welding on steel.

Other Influencing Factors

The intensity and distribution of galvanic corrosion is influenced by many factors in addition to those cited above. One of the most important of these is the conductivity of the complete circuit. Since the voltages developed are very low, any practice that will increase the resistance or interrupt the circuit will minimize if not eliminate galvanic action. The partial or complete insulation of the metals at their points of contact or connection is very effective. The hydrogen which collects on the surface of the lesser attacked metal during corrosion acts in effect as an insulator and thus tends to suppress corrosive action on the more attacked surface.

Galvanic action can also be retarded by reducing the amount of dissolved oxygen. Oxygen tends to combine with the newly formed hydrogen and remove it as water. Since the removal of the hydrogen film allows corrosive action to continue, the presence of oxygen should be minimized.

Recommended Practices

(1) Use combinations of metals as close together in the galvanic series as possible.

(2) Keep dissimilar metals as far apart as possible. This rule applies even when the actual connection between the metals is external to the corrosive liquid.

(3) Avoid threaded connections for joining metals well apart in the series. Instead employ brazed joints, using a brazing alloy that is more noble than at least one of the metals to be joined.

(4) Avoid combinations in which the area of the less noble metal is relatively small.

(5) Insulate dissimiliar metals wherever practicable. If complete insulation cannot be achieved, a paint or plastic coating at the joints will increase the resistance in the circuit and so help to reduce corrosion.

(6) Apply coatings with caution. When painting, for example, do not paint the less noble metal without also coating the more noble. Otherwise a greatly accelerated attack may be concentrated at imperfections on the coating of the less noble metal. Coatings, needless to say, should always be kept in good repair.

(7) If practicable, add chemical inhibitors to corrosive solutions.

(8) Install pieces of bare zinc or steel to provide a counteracting galvanic effect tending to suppress unwanted galvanic corrosion.

SAFETY

To paraphrase Tom Jefferson, "Eternal vigilance is the price of safety"

CLOSE examination of the causes of "welding fires" usually divulges that it was not welding but the failure of someone to follow safety rules that was the real culprit. Ever since the oxyacetylene flame was conceived and adapted to the joining and severing of metals, the gas-welding people have worked vigorously to promote the safe use of these combustible gases. Here are some of their suggestions:

(1) Before any cutting or welding is done in a new location, the nearest foreman or the superintendent should be consulted with regard to possible fire hazards.

(2) Remember that sparks can fly long distances and start fires in combustible materials wherever they land. If cutting is to be done, materials that burn easily should be at least 30 ft from the torch. A 50-ft separation would be even better.

(3) Use sheet-metal guards, asbestos paper, asbestos curtains or something that is really fireproof to keep sparks close to the work. Do not use tarpaulins.

(4) Floors in the immediate vicinity should be swept clean before the torch is lighted. Wooden floors should be wet down.

(5) Never weld or cut on tanks that have held gasoline without taking special and extraordinary precautions. If you would like more information, address a query to the International Acetylene Association, 30 East 42nd St., New York 17, N. Y.

(6) Fire extinguisher, water hose, or pails of water and sand should be ready for instant service when needed.

Yes, the rules have all been written, and management and workers need only adhere to accepted thinking in order to end disastrous welding fires.

The health of the weldor has always been of primary concern to welding trade associations and private companies. All branches of the industry have joined forces to produce healthful working conditions.

Years of medical research have proved that the average weldor experiences little or no eye discomfiture when he is adequately protected from the penetrating arc or intense flame. But goggles, helmets or eye-shields are necessary. Research into industrial fumes has likewise shown that no ill effects develop from welding fumes under normal conditions. But ventilation and/or welding-fume removers are indispensable. Particularly is the need for ventilation acute when welding is being done in confined spaces or on galvanized materials, zinc-base alloys, lead or cadmium.

What Load Will a Welded Joint Carry Safely?

By R. J. HOFFMAN

Estimated safe loads on arc-welded joints may be obtained readily from the accompanying alignment chart without having to make tedious calculations. It is constructed on the basis of accepted stresses of 13,000 lb. per sq. in. for tension, 15,000 lb. per sq. in. for compression, and 11,300 lb. per sq. in. for shear, all loads acting through the center of gravity of the section; eccentricity would increase the stresses beyond the uniformly distributed stresses assumed.

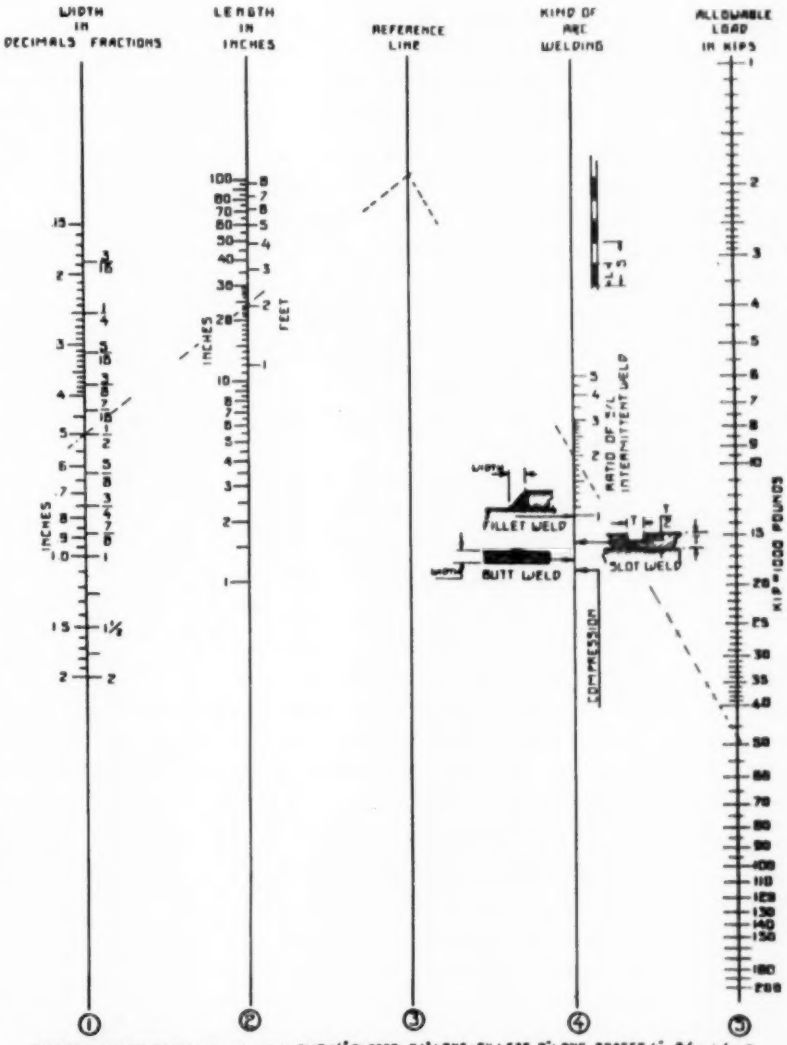
For shear calculations, the cross-sectional area is to be taken through the throat of the fillet weld; this inconvenience to the estimator is eliminated by assuming that the fillet weld has always the form of an isosceles triangle of 45° and that the throat dimension is replaced by the leg dimension, thereby reducing the allowable stress to 8,000 lb. per sq. in. for the area of the fused surface—usually the length of the weld times the plate thickness.

The chart estimates the allowable loads on arc-welded connections for fillet welds, intermittent fillet welds, butt welds, and slot welds.

For convenience, the chart is appended with a specific example, for which the lines are marked on the scales. In order to preserve the chart it is only necessary to lay a straight edge across the scales and place a pencil point at the intersection of the two lines on the reference line.

This chart can be used if any three factors are known and the fourth one to be found. Though the example given at the foot of the chart has to do with determining the allowable load, the chart can also be used for other calculations.

For example, to find the length of the weld necessary which will hold a certain load, if the width and the kind of weld to be used is known, we connect the values on scale No. 5 and scale No. 4, intersecting the reference line; then we connect the intersection point with the width on scale No. 1 and find the length required on scale No. 2. Other problems like the finding of the spacing of intermittent welds if the length, the thickness and the load are given, are also easily solved.



Allowable Working Pressure on Welded Flat Tank Heads

SHOP

Here's what a well equipped shop should have to keep costs down

THE UNSUNG heroes of many a successful welded fabrication are the miscellaneous shop equipment that goes into action after the design leaves the drawing board. One of the major duties of the designer is to know what equipment the shop has and how it can best be utilized. Unless he knows how his shop is equipped, it will be impossible for him to design products that take the fullest advantage of welding.

Every reader of this page is thoroughly familiar with the fact that a weld made in the flat position is the easiest to make and can be done at speeds up to 50% faster than position welds. Nobody can be found to dispute that statement. Yet a surprising number of plants are producing weldments unaided by positioners, turning rolls or other work-handling fixtures. And management is wondering why welded fabrication costs so much.

Work-handling equipment such as positioners, turning rolls, etc., when coupled with automatic welding equipment and electronic controls, make it possible to produce completely automatic weldments. Such methods of automation offer the best means of reducing labor costs and of competing in the present buyer's market. Yet manufacturers continue to work with antiquated methods.

Of course, handling equipment is not the only method of making additional savings. Hundreds of special tools have been developed for use in connection with metal-fabricating operations. Intelligently designed jigs and fixtures will speed assembly and cut rejects by making it impossible to assemble a wrongly constructed part.

When metal cleaning on a large scale has to be done, either prior to or after welding, the job may be done faster and much more efficiently with an abrasive blasting machine. It is surprising how inexpensive such equipment proves itself to be when it is compared to the cost of hand-cleaning methods.

Is a lot of sheet-metal work going through your shop? Possibly a press brake and shears are items of equipment that will save you money. They may appear to represent a heavy investment, but if they pay for themselves in a year or two, you can hardly afford to do without them.

Study the jobs you are now undertaking, or would like to get. Make sure that your shop equipment is adequate.

Twist Drill Size Data

Drill sizes are in fractions of an inch, in Standard Twist Drill letters or in Standard Twist Drill numbers. In addition to showing the diameter of the drills or the orifices made by them, the table includes the cross-sectional area of the drills or orifices in square inches. This information will be useful in estimating gas flow and related data.

$\pi \times 12 \times 1$ foot = 37.70 in.	Log 1.5763	Feet to Inches	To find areas and volumes by the formulas given above, select the proper constant from those given at left and multiply it by the radius raised to the required power. Example: Volume of a sphere with a radius of 10 in. = $10^3 \times 0.002424$ cu ft = 2.424 cu ft. Conversion is made automatically from inches to feet or vice versa.
$\pi \times 144 \times 1$ sq ft = 452.4 sq in.	Log 2.6555

CLASSIFIED LIST

OF WELDING APPARATUS, EQUIPMENT, TOOLS AND SUPPLIES, AND MANUFACTURERS THEREOF

IN this section products are listed alphabetically and constitute the headings. Under each heading are listed (again alphabetically) the names of manufacturers of the product referred to, together with the cities in which their main offices or general sales offices are established.

In the great majority of cases product headings are arranged alphabetically according to the noun, with the descriptive adjective or adjectives, where there are any, following, for instance, "Electrodes, Aluminum" and "Positioners, Welding." In a comparatively few cases, for reasons considered logical, products are arranged alphabetically according to the descriptive adjective. While we have used cross references extensively there may be cases where they have been inadvertently omitted. Therefore, we would advise the directory user, if he does not find a certain product listed according to the noun and there is no cross reference to turn to the place where the item would appear if listed according to the descriptive adjective.

An all-position DC electrode

Right down to the stub, a Hobart "10" electrode is chock full of welding ease and efficiency. It has a stable, deeply penetrating arc—deposits a smooth, flat bead of high tensile strength and ductility—assures quick, easy slag removal and non-porous welds.

Widely used in the welding of high pressure mild steel piping, pipe lines, structural steel, oil well casing, boilers, storage tanks and ships, the Hobart "10" is especially well adapted for work where tie-up stresses are involved—or where the weld must be susceptible to flanging or cold bending and forging.

It's just another example of a Hobart Electrode designed to give you better, faster welds at lower cost. Why not give it a chance to prove its worth on your work? Check and mail coupon today for free samples to try on your next job.

HOBART No. 12 (E-6012)

Does 80% of your production work . . . DC or AC

The Hobart "12" is such a versatile, all-purpose electrode that you can actually STANDARDIZE on it.

As a matter of fact, many of the country's largest fabricators of tanks, automobile frames, agricultural implements, etc. already have. They tell us that it handles over 80% of all their production work—and actually costs them less than any other E-6012 electrode they've ever used. That's because, with a Hobart "12," there's less spatter and stub loss — less cleanup time — more actual weld deposit. What's more, a Hobart "12" operates efficiently on very high welding currents — lets you increase your welding speeds.

It's just another example of a Hobart Electrode designed to give you better, faster welds at lower cost. Why not give it a chance to prove its worth on your work? Check and mail coupon today for free samples to try on your next job.

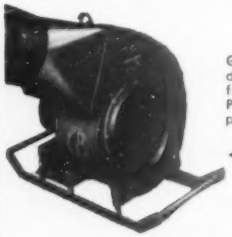
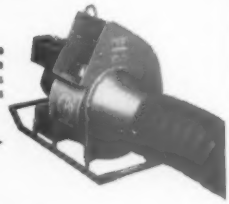
FRESH AIR WITH GENERAL FUME EXHAUSTERS

■ Elimination of welding fumes or noxious gases have increased production and cut costs. GENERAL quality-controlled Fume Exhausters have played an important role in providing proper ventilation in weldments.



Gas Engine driven welding fume exhauster. Portable unit in pressure service.



Gas Engine welding fume exhauster draws out foul noxious fumes.

PORTABLE or SEMI-PORTABLE UNITS

■ The two illustrated are gas engine driven units supplying fresh air to—or removing foul, noxious fumes or smoke from confined working areas.

■ Especially advantageous for Tank or Ship Building construction and supplying fresh air to caissons, Tunnels, Etc. Ship Builders use the heavily constructed General engine or motor driven—portable or stationary welding fume exhausters.

GB FLUXES

The physical properties and appearance of a brazed joint are controlled to a large degree by the flux which is used. For this reason it will pay you to team-up GB Flux with GB Silver Solder — they were developed to produce maximum results when used together.

GB Flux No. 88 for Silver Brazing

Fully active to 1650° F, low-glare and low-fuming. Developed for silver brazing steel, brass, copper, stainless steel, monel, nickel, inconel, chrome alloys, silver and gold.

Write for descriptive circular!

Other Brazing Operations

The GB line of fluxes is complete, including those for aluminum-bronze, manganese-bronze, etc. Your request will bring complete information.

PERFORMANCE

"FLUXINE" Fluxes are the result of over fifty years of scientific research into the metal-joining field. There are 28 FLUXINE Fluxes . . . one for every welding, silver soldering, brazing, and soft soldering operation . . . each with its own properties, designed for a particular metal-joining operation. All have been perfected not only for highest efficiency, speed, and long life, but for economy and safety as well. FLUXINE Fluxes produce no injurious fumes to irritate eyes or nose of the operator.

Write on your company letterhead for a generous sample stating which FLUXINE Flux you desire.

ELEMATIC

Indicating and Recording Flowmeter

Elematic Flowmeters are specifically designed to give an accurate record of argon gas or oxygen flow for controlling and determining cost. They are adaptable to a regulated cylinder supply or a piped system.

Individual job billing costs can be charted. Quick check of welding apparatus efficiency is provided at all times. Insufficient flow can be immediately detected. Flow is permanently recorded for 24-hour or lesser periods on an easy-to-read chart.

Gauges available in two sizes: with 4½" chart from 0-15 LPM to 0-100 CFH; with 10" chart from 0-25 to 0-300 CFH. Both models are supplied for operation at approximate inlet pressures of 20 or 50 PSI, depending on specification.

APPLICATIONS:

Manual or mechanized shielded inert gas arc welding equipment: Heliarc, Heliweld, Sigma, Aircomatic, Fillerarc.

FEATURES:

Easily installed and operated. Minimum maintenance. Non-lubricated. Self-contained ink reserve. On-off time recorded.

USE THE NATION'S No. 1 WELDER'S GLOVE

You will be convinced

These gloves are made from (1) finest grades of chrome split leather treated against shrinkage (also made in one-finger and full mitten styles). (2) The back is cut in one piece eliminating seams on back of hand which burn through and rip when exposed to heat. (3) Wool heat breaker stitched inside back provides good insulation against heat during entire life of glove. (4) Seams are welted for extra strength at all points of greatest wear. (5) Thumb seam full-welted. Use STEEL-GRIP quality.

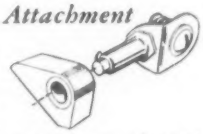
Double the Guard
on welding jobs . . .

with the
M·S·A Combination
Skullgard—Welding Helmet
There are plenty of welding jobs where head protection is as vital as face protection. The M.S.A. combination Skullgard-Welding Helmet is the practical, comfortable solution to both hazards. The fracture-resistant Skullgard protects against head injury from falling objects, while the Welding Shield guards against weld-flash and heat.
Instant Release Attachment


Allows quick, easy removal and replacement of Welding Shield while Skullgard is being worn. Attaching posts of Shield slide into two, non-conducting plastic lugs on each side of helmet. Posts are equipped with spring catches. Light push on post ends retracts the catches, freeing the Shield from the Skullgard. Friction joints permit pivoting of shield for work inspection.

Check Your Amps For Better Welding Quality

Yes—there's an easy, quick way to measure actual welding current. Simply clamp the **Columbia Tong Test Ammeter** around the electrode cable. Instantly you get an accurate ampere reading, without breaking the circuit.

Tong Test is the only clamp-type instrument that can be used on both AC and DC. It is safe, convenient and light in weight.

Assure good welding quality by controlling your amperage. Tong Test is low in cost and will be a profitable investment in preventing costly defects and rejects. Four types with interchangeable ranges to 1000 amperes.

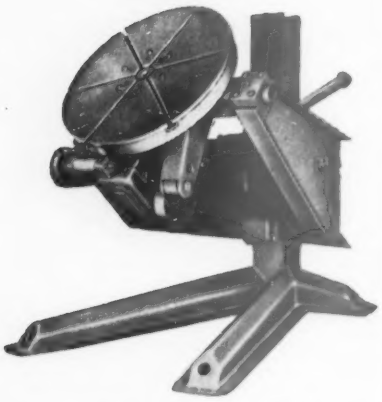
P&H Positioners – save time, improve welds, and cut costs!



Complete range of sizes to handle work ranging from 2000 to 36,000 lbs.

P&H positioners end slow, costly, out-of-position welding. Many users report cost cuts of 50%. Here's why:

- **They speed welding**—permit down-hand welding with larger, hotter rods for faster deposition.
- **They cut handling costs** — no extra men, hoists, cranes required to rearrange weldment.
- **They improve work quality**—fillets and beads are smoother, neater, more uniform.
- **They increase safety**—eliminate hazards of handling heavy weldments.

Call in your P&H representative. He can show you how P&H welding positioners can save you money in your plant. Write for free bulletins today.

SPATTER-EX COMPOUND

PREVENTS BONDING OF WELDED SPATTER

Effective in either Arc, Flash or Butt Welding

Simply coat surfaces which will be struck by spatter. A film is formed, preventing bonding.

★ ★ ★

FLASH-EX COMPOUND

Prevents adhesion of welding spatter on multipass welds or on single pass welds where heat is intense. Also used to prevent bonding of flash to dies and holder jaws of automatic welding machines in resistance welding.

Use of Flash-Ex prevents imperfect welds by eliminating possibility of spatter "shooting across" the jaws as when build-ups occur. The durable coating permits many more applications than ordinarily.

Write for samples or send trial order.

It's a cuttin' fool!

Look what this *NEW* Smith's Cutting Torch gives you:

It is brand NEW. It ingeniously combines more operating advantages than any you have ever seen. Trade tests to date have been sensational. Check these facts and write us today.

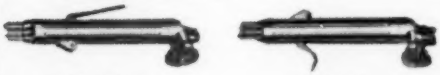
Does the work of a heavy-duty torch . . . but you should see how LIGHT it is—and easy to handle!

Cuts anything from tomato cans to 14" steel (using proper tips). Yet it's light-weight and perfectly balanced. A brute for performance but easy on the operator. We put into this torch what you and other operators asked for.

Slip-In-Tips—no wrenches needed.

Just slip the tip in, spin the nut with your fingers and you're ready to go. How could anything be easier? Try it yourself and see.

3 interchangeable controls—quick change from one to the other in less than 1 minute.



1. Over lever. *2. Trigger.* *3. Under lever as shown above.*

No matter what type of cutting jet control you prefer, you have it in this torch—and you can switch from one to the other any time you want. Adaptable to any personal likes or techniques. Reduces number of torches needed to accommodate all operators' requirements.

No slag . . . cuts clean.

The new Smith Tips with this torch give you clean, knife-line cuts with narrow kerf and almost complete absence of slag. Operator does not have to waste time cleaning up his cuts. Speeds up production. Want a demonstration?

Miller Selenium Rectifier Type D.C. Arc Welders

. . . performance, dependability, ease of maintenance unmatched by any other! *Pulsating* direct current produces sounder, denser welds; minimizes magnetic arc blow and "arc-outs." SR Welders have wider ranges than any other D.C. welder; polarity reverses at the flick of a switch. Miller's patented UNITRAN *combines* transformer and flux diverter. Easily remote controlled or paralleled in combination with other SRs. Models with rated outputs (60% duty cycle at 40 volts) of 200, 300, 400 and 600 amperes.

Pride in Reputation

"... if it's **miller** you know it's the finest"

Miller Heavy-Duty Industrial A.C. Arc Welders

These transformer-type welders achieve high-quality welds at maximum production speeds, feature low maintenance and long life. Ample open circuit voltage stabilizes arc, minimizes "arc-out" time, permits use of all A.C. or A.C.-D.C. electrodes. Continuous current control. Models 103, 104, 105 rated at 300, 400 and 500 amperes, respectively (60% duty cycle at 40 volts). Power factor correction at slight additional cost. Models 107, 108, 109 have selective open circuit voltages for automatic welding. Rated secondary amperes (60% duty cycle at 40 volts) are 750, 1000 and 1500 respectively. All three models power factor corrected.

Miller Constant Potential Rectifier Type Sigma Welder

Model SIGMA-5 maintains stable welding conditions regardless of arc variations. Operator can set wire feeding speed on SIGMA head and arc voltage on SIGMA welder. After arc is struck. Model SIGMA-5 automatically regulates filler wire speed and current to maintain constant arc length. Power for SIGMA head and control circuit furnished from within welder. May be paralleled and/or remote controlled. 500 ampere rated output on 100% duty cycle at 30 volts.

DC RECTIFIER is good welding 'RITHMETIC

Advantages of M & T's new rectifier welder add up to greater welding economy:

Power Economy through Precision—Metal & Thermit D.C. Rectifier's precision-wound coils are designed with built-in surge that guarantees an instant arc without starters or boosters.

Maintenance Economy through Simplicity—No moving parts to wear out, no commutators to corrode or turn down, no bearings and brushes to repair. Inner parts readily accessible by simply unscrewing front or back panel.

Production Economy through Design—A moving coil design eliminates vibration and undesirable magnetic forces; positive air separation between coils prevents insulation failure; high velocity ventilation is designed for preferential cooling, assuring long, trouble-free operation without gadgets.

MORTON OFFERINGS FOR JET ENGINE PROGRAMS

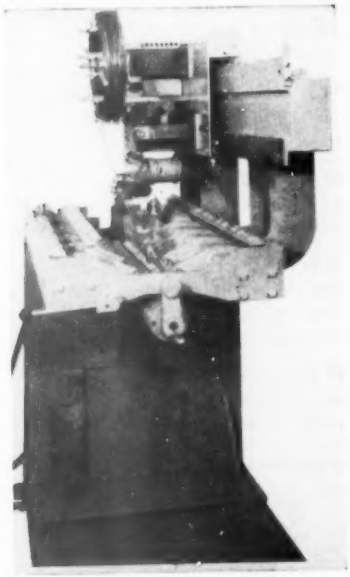

FIG. 3079 Bulletin 44-B

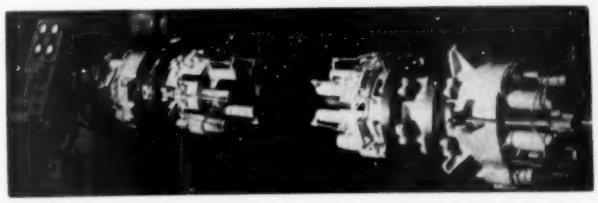
Shows our new design Model "A-3" Horn Type *Stake* Welder. The machine offers a new type of clamping arrangement advantageous for light gauge materials with no tendency for seam separation. The new design also offers less operator interference and better visibility through a more compact clamping design. At the same time this new design will include the features of all Morton Stake Welding Machines.

FIG. 2930, Bulletin No. 35-B

Morton 16" Stroke Heavy Duty Flash Trimmer Hydraulically Driven. It is arranged for flash and circular work having 9" minimum lower horn. It has 2" of operating distance between the dies and capacity for removal of flash of various alloys up to ¼" thick.

FIG. 3094-B



Morton Four Section Expanding Mandrel shown is designed to handle five separate shells and flanges and weld them into one component. Each section is under separate hydraulic control and expands a continuous back-up bar under each weld joint with approximately 10,000 lb. force available.

MORTON MANUFACTURING COMPANY, Muskegon Heights, Michigan

NEW!

SPOT WELD without jigs or back-up plates

Now you can spot weld with complete maneuverability — and as fast as you can pull the trigger — with the new portable AIRCOSPOT® Gun.

With **AIRCOSPOT,** Air Reduction's new inert-gas-shielded spot welding unit, you simply touch the water-cooled gun to one side of the work and pull the trigger. In about a second you have a spot weld. It will be a good one, too, because **AIRCOSPOT'S** inert gas shield completely protects the hot metal from contamination by the air.

Write today for prices and folder that provides detailed information.

AIRCOSPOT welds all sheet steels — including stainless up to 3/32"—to bottom sections of varying thickness.

AIRCOSPOT is fast. Once the controls are set, you can make thirty or more welds a minute.

AIRCOSPOT is easy to use. Operators need no special training. The welding cycle is fully automatic.

AIRCOSPOT is handy. Gun weighs four pounds, is nine inches long. All connections—current, gas and water—are through a single control panel.

AIRCOSPOT is rugged. No abuse-sensitive high frequency or electronic circuits, because Gun is of electromechanical design.

Whether your weld grinding is LIGHT, MEDIUM, or HEAVY there's a Norton wheel for the job

FOR LIGHT-DUTY WELD GRINDING, depend on the remarkable new Norton BFR Semi-Flexible *Reinforced Resinoid* Hub Wheels. Excellent for blending and smoothing welds. Their contour-hugging flexibility is combined with extra long life and extra, built-in safety. These wheels are also handy for cutting and notching.

FOR MORE SEVERE WELD GRINDING, choose Norton BD Rigid *Reinforced Resinoid* Hub Wheels. These durable lightweight wheels are easy to handle for rapidly cutting down weld beads, also for smoothing flame-cut edges. Like the BFR wheels, they are reinforced with protective layers of strong fabric, thus assuring extra safety.

FOR HEAVY-DUTY WELD GRINDING, rely on Norton regular grinding wheels—straight, cup and cone. Their controlled uniformity and built-in balance cause less fatigue because they hug the work, cutting continuously and smoothly. These wheels have the fast cutting action and long life, that cut grinding costs on the most severe jobs.

SEE YOUR NEARBY NORTON DISTRIBUTOR for help in choosing the right Norton wheels for your weld-grinding. He's listed under "Grinding Wheels" in your classified telephone directory. Or write for Booklet 1405E. Norton Company, Worcester 6, Mass. Distributors in all principal cities. Export: Norton Behr-Manning Overseas Incorporated, Worcester 6, Mass.

TRADE NAME INDEX

An Alphabetical List of Trade Names Employed by Manufacturers of Welding Equipment, Tools and Supplies Whose Products Are Listed in this Buyer's Reference Number, with the Names of the Manufacturers and the Products to Which they Refer.

THE fact that trade names appear in this list does not mean that we guarantee them to be registered or the property of the manufacturers concerned.

WARNING—Therefore, no user of this reference, should, without independent verification, rely upon any information appearing in this section when so doing might result in loss or damage of any kind.—McGraw-Hill Publishing Company, Inc.

In the cases where two or more companies have submitted the same trade name for the same product and there is any question as to the rightful owner of the trade name, we have eliminated it entirely from our list.

Where initials are shown as trade names in this list, they are grouped at the start of the listings under each letter. Where two or more separated words or hyphenated words constitute a trade name, such as "Sure Hold" or "Sure-Hold," the first word standing alone determines the location of the listing, whereas when the two words are used as one, such as "Surehold," the name is listed in order according to the entire word.

Some trade names may have been inadvertently omitted. At the same time, some names you consider to be trade names may not be such, in fact. Therefore, if you cannot locate the name for which you are looking in the "Trade Name Index," look for a similar name in the "Classified List" among the manufacturers shown under the product in which you are interested.

Let's face it!

HAVE YOU A DISASTER PLAN FOR YOUR PLANT?

BOMBS...OR FIRE...OR FLOOD...OR TORNADO ...you can handle them if you act now.

Let's face it . . . the threat of war and the atomic bomb has become a real part of our life—and will be with us for years. Fires, tornadoes and other disasters, too, can strike without warning.

Whatever the emergency is, everybody's going to want help at the same time. It may be hours before outside help reaches you. The best chance of survival for you and your workers—and the fastest way to get back into production—is to know what to do and be ready to do it. Disaster may happen TOMORROW. Take these simple precautions TODAY:

☐ **Call your local** Civil Defense Director. He'll help you set up a plan for your offices and plant—a plan that's safer, because it's integrated with community Civil Defense action.

☐ **Check contents** and locations of first-aid kits. Be sure they're adequate and up to date. Here, again, your CD Director can help. He'll advise you on supplies needed for injuries due to blast, radiation, etc.

☐ **Encourage personnel** to attend Red Cross First-Aid Training Courses. They may save your life.

☐ **Encourage your staff** and your community to have their homes prepared. Run ads in your plant paper, in local newspapers, over TV and radio, on bulletin boards. Your CD Director can show you ads and official CD films or literature that you can sponsor locally. Set the standard of preparedness in your plant city. There's no better way of building prestige and good community relations—and no greater way of helping America.

Act now . . . check off these four simple points . . . before it's too late.

NAMES AND ADDRESSES

IN this section are arranged alphabetically the names of manufacturers of welding equipment, tools and supplies whose products are listed in the Classified List, together with their addresses. Only one address is given for each company, that being its main or general sales office, or the one otherwise specified by the company —except where manufacturing activities are so divided between two or more plants of a company that certain lines are produced in one plant while others are made elsewhere and orders should be placed according to the plants in which they are manufactured.

Disregard individual's initials or the word "The" in locating the name of a manufacturer. The name of a company such as D. B. Gorbound & Co. would be listed "Gorbound, D. B., & Co." Where the prefix "The" is used, a company is listed as follows: "Morgan Co., The." Where initials form the main part of a name, as, for instance, "B. & R. Pipe Co." the names of such companies are grouped with others of a similar type at the start of listings appearing under the first initial. For instance, "B. & R. Pipe Co." would be found among the first few names appearing under "B."

For convenience, we have generally used "Co." instead of "Company" and "Corp." instead of "Coporation," regardless of whether the company or corporation spells out the word. Similarly, we use "Inc." uniformly instead of "Incorporated."
